

Decision Trees(CART – Classification and Regression Trees): -

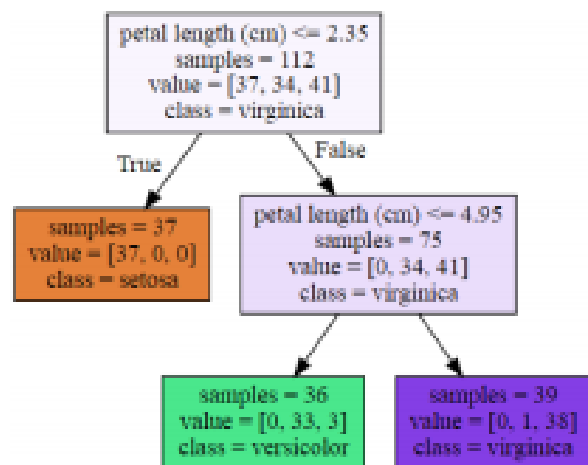

Split 1
(60)

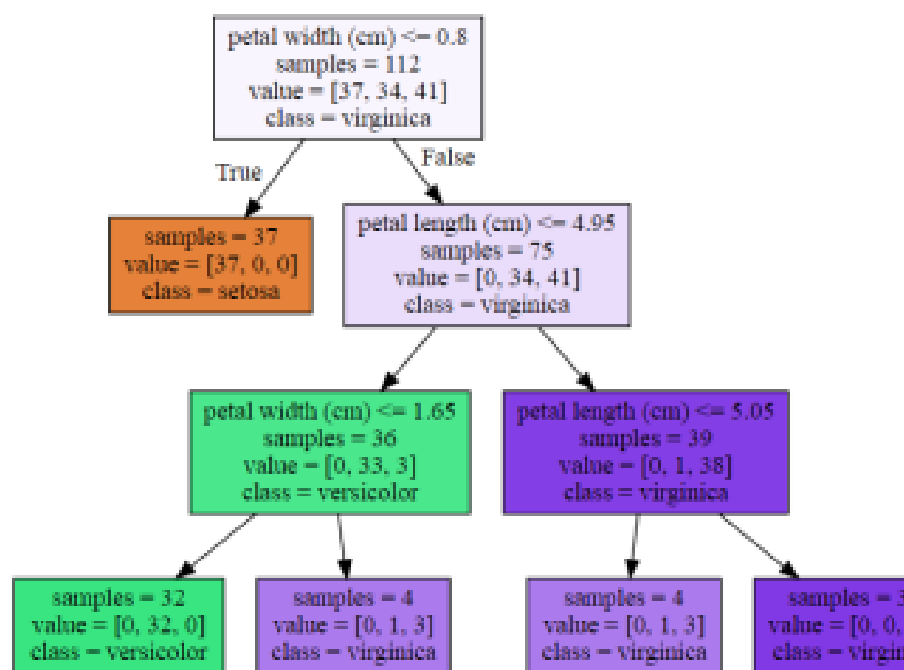

- `max_depth`: controls maximum depth (number of split points). Most common way to reduce tree complexity and overfitting.
- `min_samples_leaf`: threshold for the minimum # of data instances a leaf can have to avoid further splitting.
- In practice, adjusting only one of these (e.g. `max_depth`) is enough to reduce overfitting.
- Entropy and Gini are two different criteria used in a decision tree.

`max_depth = 2`

`max_depth = 3`

`max_depth = 4`
